In the Claims:

Please amend claims 1, 5-9 and 16 as follow:

Claim 1. (Currently amended) A system for automatically configuring a plurality of different types of network devices, comprising:

A memory for storing a library and a database;

the library being a library of generic commands that can be applied to said devices and converters for converting each of said generic commands into device-specific commands to be applied to individual network devices;

the database being a database storing configuration parameters for said plurality of network devices; and

a hardware processor configured to provide a configuration interface;

the [[a]] configuration interface [[which]] receives said parameters from said database and issues generic commands to said library to cause individual ones of said devices to be configured using said device-specific commands and in accordance with said parameters;

wherein said configuration interface displays identifications of firewall devices associated with a network and conduits within said firewall devices, and permits a user to select at least one of said firewall devices.

Claim 5. (Currently amended) The system of claim 1 wherein said configuration interface communicates with said database to obtain the identifications of the firewall devices and generates a first display which lists said devices, and further includes means responsive to the selection of one of the devices in said list to generate a second display which lists the conduits, wherein each conduit is identified by means of descriptive names stored in said database for local and external devices and/or networks that are logically connected by the conduit.

Claim 6. (Currently amended) The [[tool]] system of claim 5, further including means responsive to the selection of one of the devices listed in said first display to generate a third display which lists internal networks owned by an entity associated with the selected device, and means to selectively open and close conduits respectively corresponding to said internal networks.

Claim 7. (Currently amended) The ~~[[tool]]~~ system of claim 6 wherein said third display further includes means for adding a new conduit to one of the internal networks.

Claim 8. (Currently amended) The system of claim 1 wherein said hardware processor, providing said configuration interface ~~[[includes]]~~:

~~means for commanding~~ commands a console server to send a message to each console connected to said console server;

~~means for analyzing~~ analyzes a response to said message provided by each console to determine the type of device which transmitted said response; and

~~means for displaying~~ displays a list of device types corresponding to the consoles connected to said console server.

Claim 9. (Currently amended) The system of claim 1 further including ~~[[a]]~~ the memory storing a template which contains a sequence of commands for configuring each of a plurality of devices of a given type, wherein each command that refers to a particular device contains a variable as the identification of the device; and wherein:

said database stores a record which indicates the respective network address of each specific device for which a given device is to be configured, and

said configuration interface is responsive to a command to configure a given device for retrieving said template and the stored record associated with said given device, substituting the network addresses in the retrieved record for the variables in

said template[, .]] and issuing commands to configure the given device in accordance with said retrieved record and said template.

Claim 16. (Currently amended) A method for automatically configuring a plurality of different types of network devices, comprising the following steps:

storing a library of generic commands for configuring said devices; linking a plurality of converters respectively associated with different ones of said network devices to said library, to convert said generic commands into device-specific commands to be applied to the associated devices;

retrieving a set of parameters from a database that pertains to the configuration of one type of network device;

in response to receipt of said set of parameters, issuing generic commands to said library to cause a device of said one type to be configured in accordance with said parameters; and

displaying a plurality of identifications of firewall devices associated with a network and a conduit for each such firewall device, each firewall device identification being user-selectable.
